

MP1 Pump Alternatives

For fans of the electric impeller driven MP1 Pump for sampling and purging deep wells, we have bad news: Grundfos has chosen to discontinue production of this pump.

We will no longer sell this item. However we still have a small selection in our [rental fleet](#).

The sensible alternative to the MP1 Pump is the **Stainless Steel Geosub** but this is only available to 50 metres. For sampling at similar depths in more hazardous environments a **Bladder Pump** can be used or, the **Snap Sampler** – a passive system suited for most groundwater monitoring and sampling situations and especially helpful in difficult conditions such as with low yield wells. For purging and developing wells that may contain product or suspended solids a **Total Fluids Pump “Reclaimer”** may be an alternative.

To help you decide take a look at our [Pump Comparison Table](#) where you can select the correct pump by either Well Diameter or Head of Water.
